Massive Star Formation Problems

Previous study

SMaSH+ (Sana et al, 2014)

The Carina High-contrast Imaging Project of massive Stars (CHIPS)

CHIPS

- Closest massive star region
- **Multiplicity properties** of 84 massive O and WR type stars
- Goal: find **faint** & **low mass** companions
- VLT/SPHERE in IRDIS/IFS modes

SMaSH+ (Sana et al, 2014)

The Data

SPHERE

- **Extreme AO** system coronagraphic facility

	IFS	IRDIS
Spectral Range (μm)	0.95-1.75	0.95-2.32
FOV (arcsec²)	1.73	11
Pixel Scale (marcsec)	7.4	12.25
Bands	Y-J-H	K
Spectral resolution	50	350

VLT Unit Telescope 3 with SPHERE installed, credit: ESO/J.Girard

➔ **4D data cube + PSF**: 2D coordinates, wavelengths, rotation angle

Data analysis

QZ Car (HD 93206)

FOV = 5', 2MASS

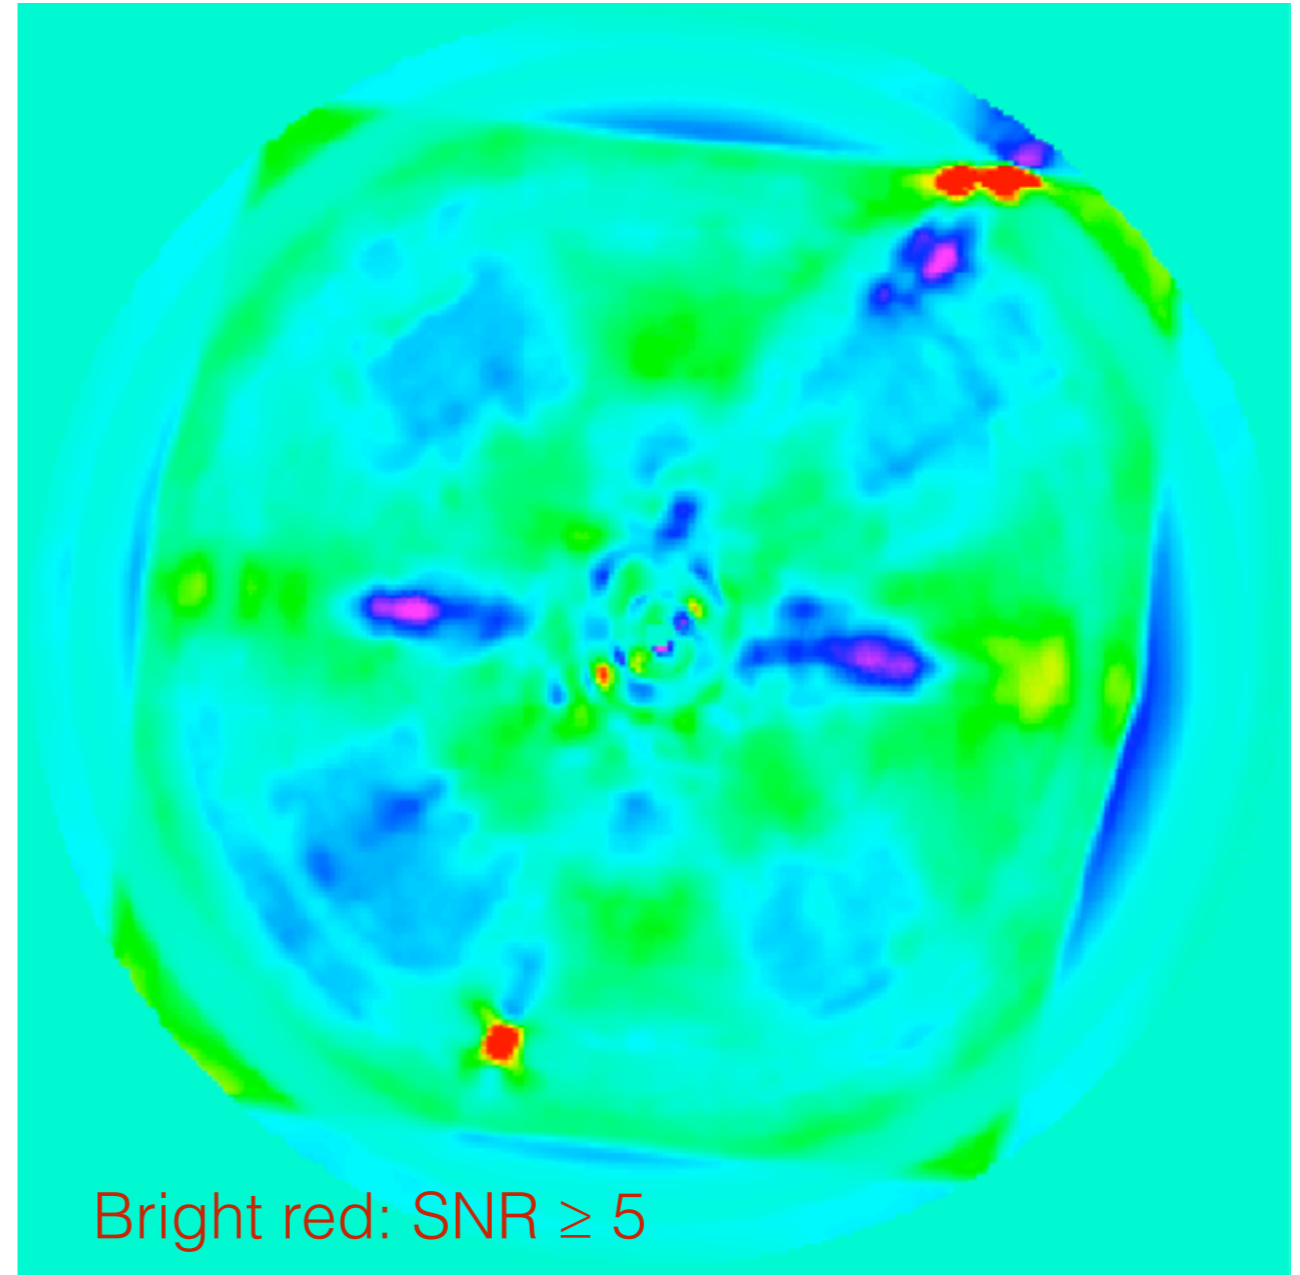

13

Detection method

Derotated and wavelength collapsed image

SNR map

SMaSH+ (Sana et al, 2014)

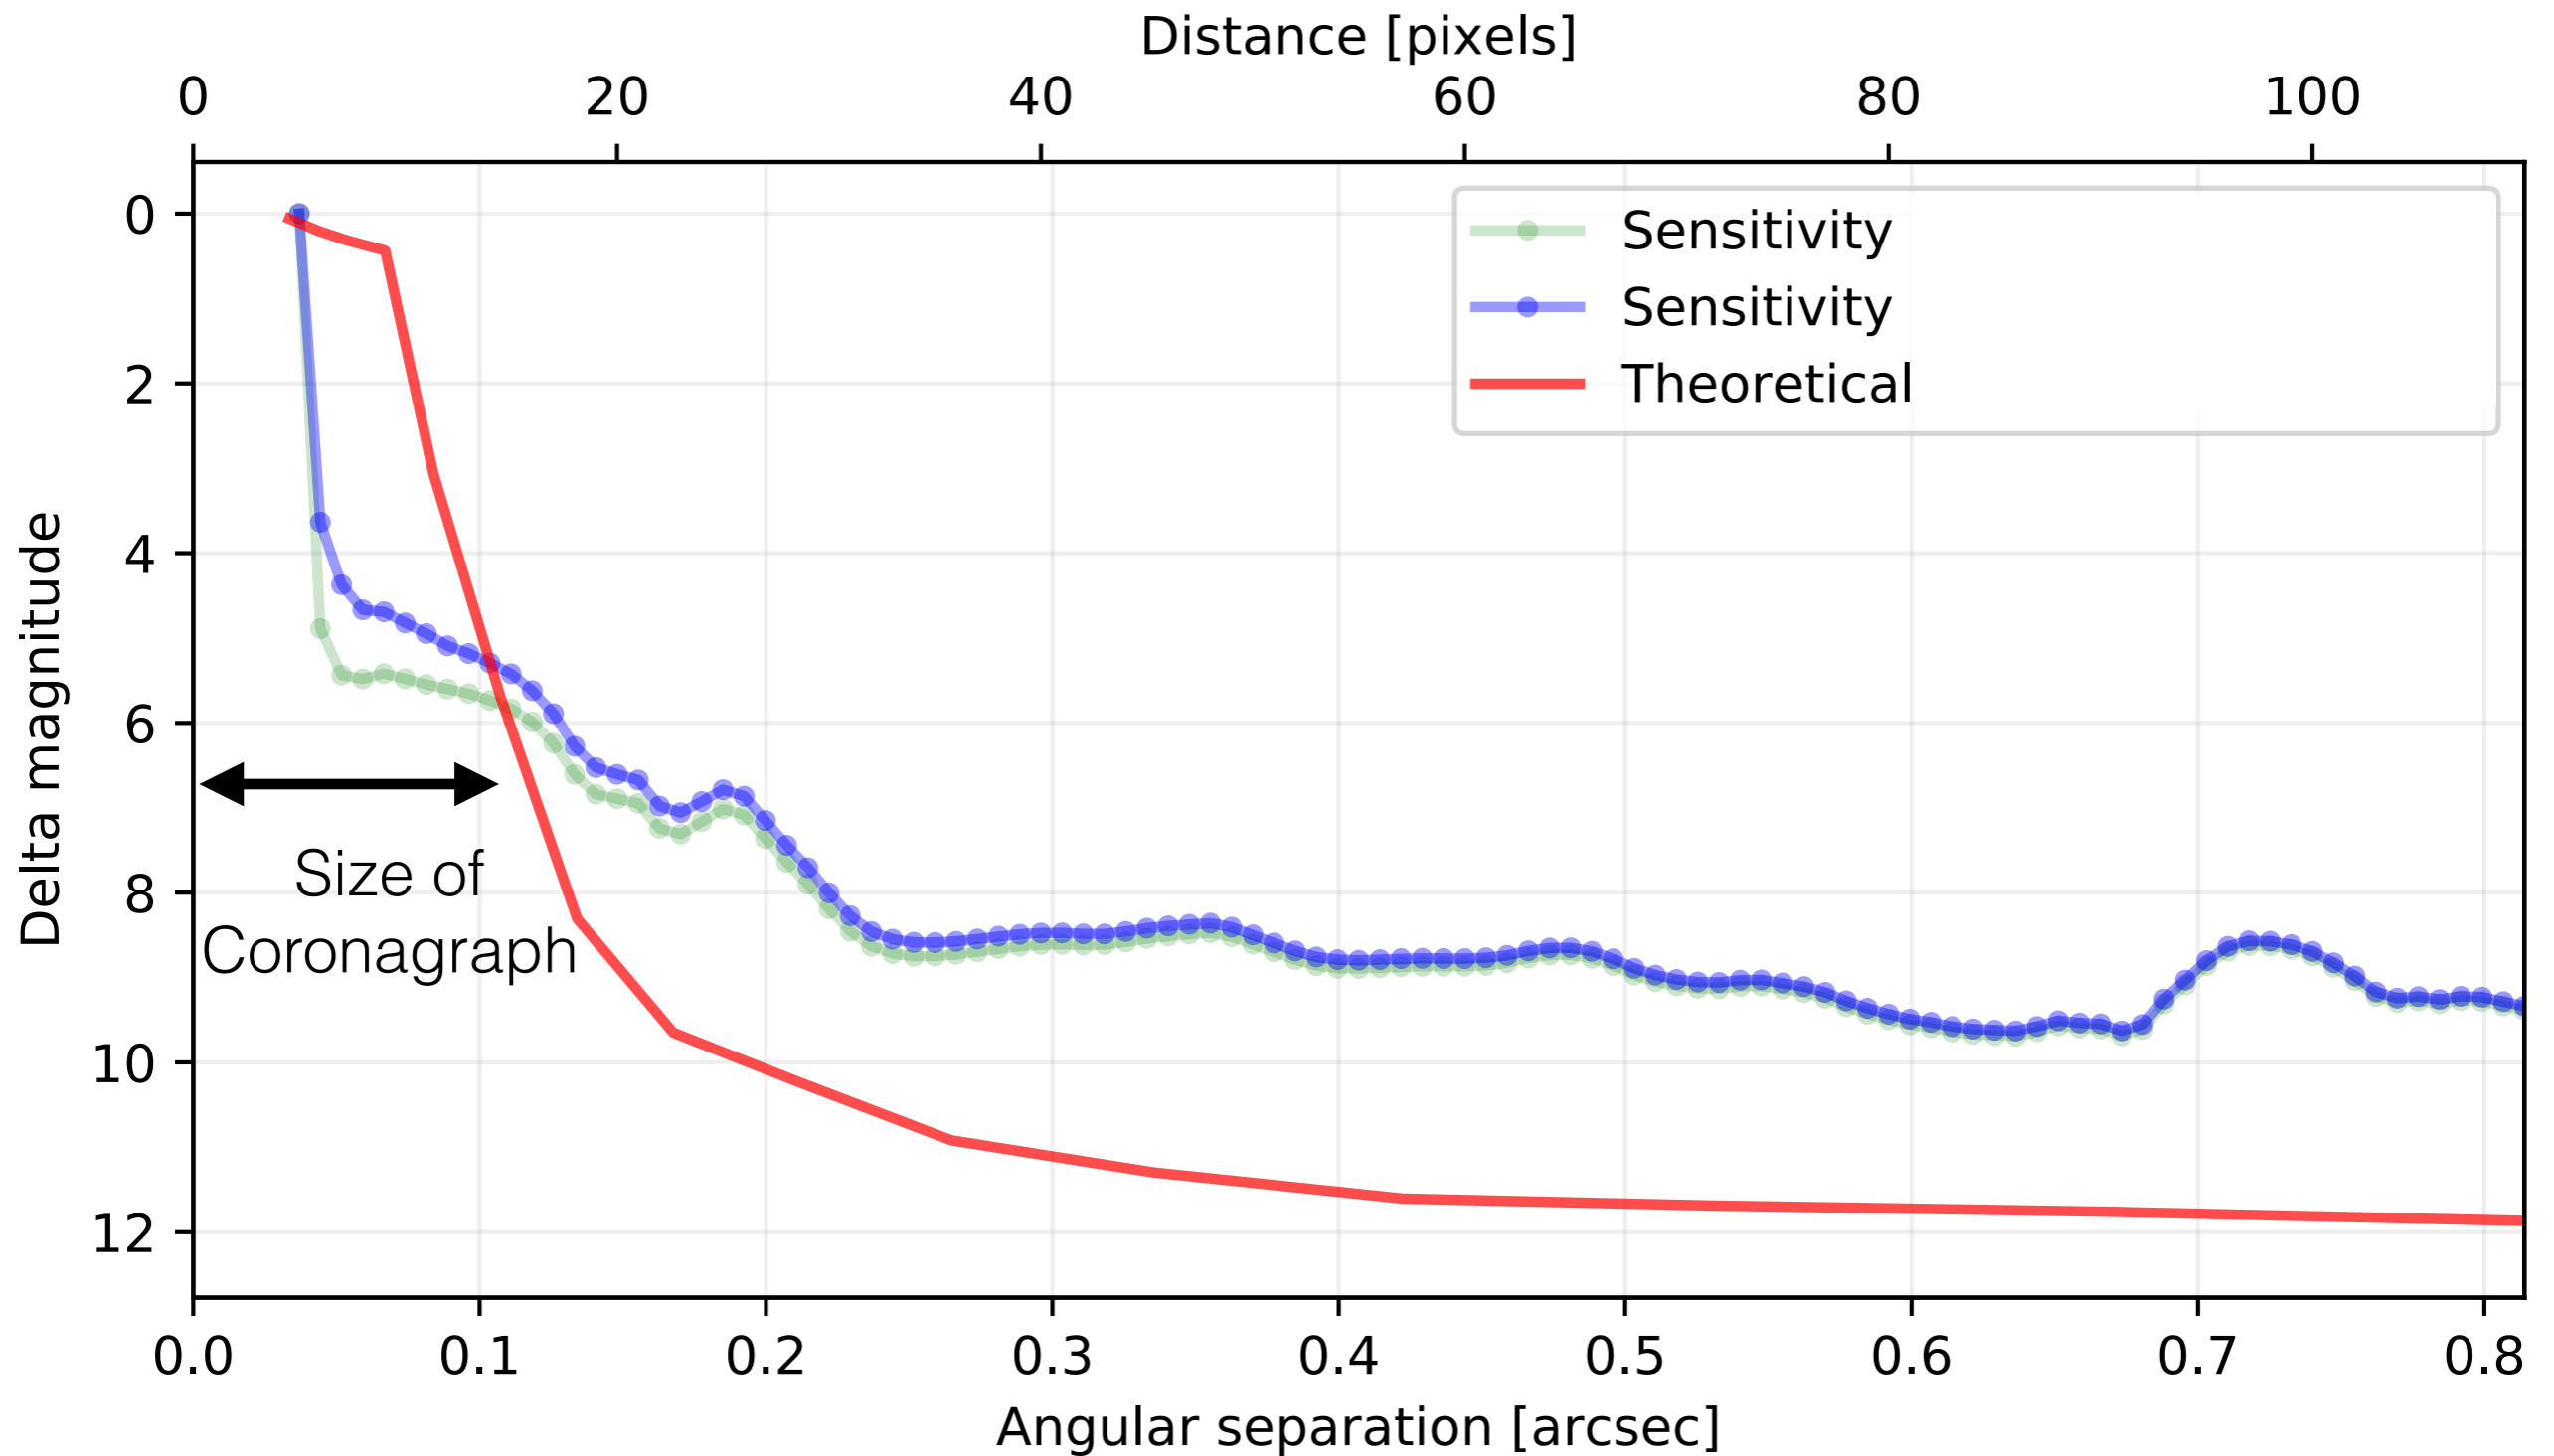

IRDIS

Contrast Curves

Needs verification

Spectrum Extraction

Analysis Techniques

- ADI: **Angular** Differential Imaging
- SDI: **Spectral** Differential Imaging
- RDI: **Reference** star Differential Imaging

Analysis Techniques

- ADI: **Angular** Differential Imaging
- SDI: **Spectral** Differential Imaging
- RDI: **Reference** star Differential Imaging
- ▶ PCA: Principal Component Analysis
 - ▶ Reference PSF subtraction
 - ▶ Spectrum Extraction: Negative fake companion & MCMC

Negative Fake Companion

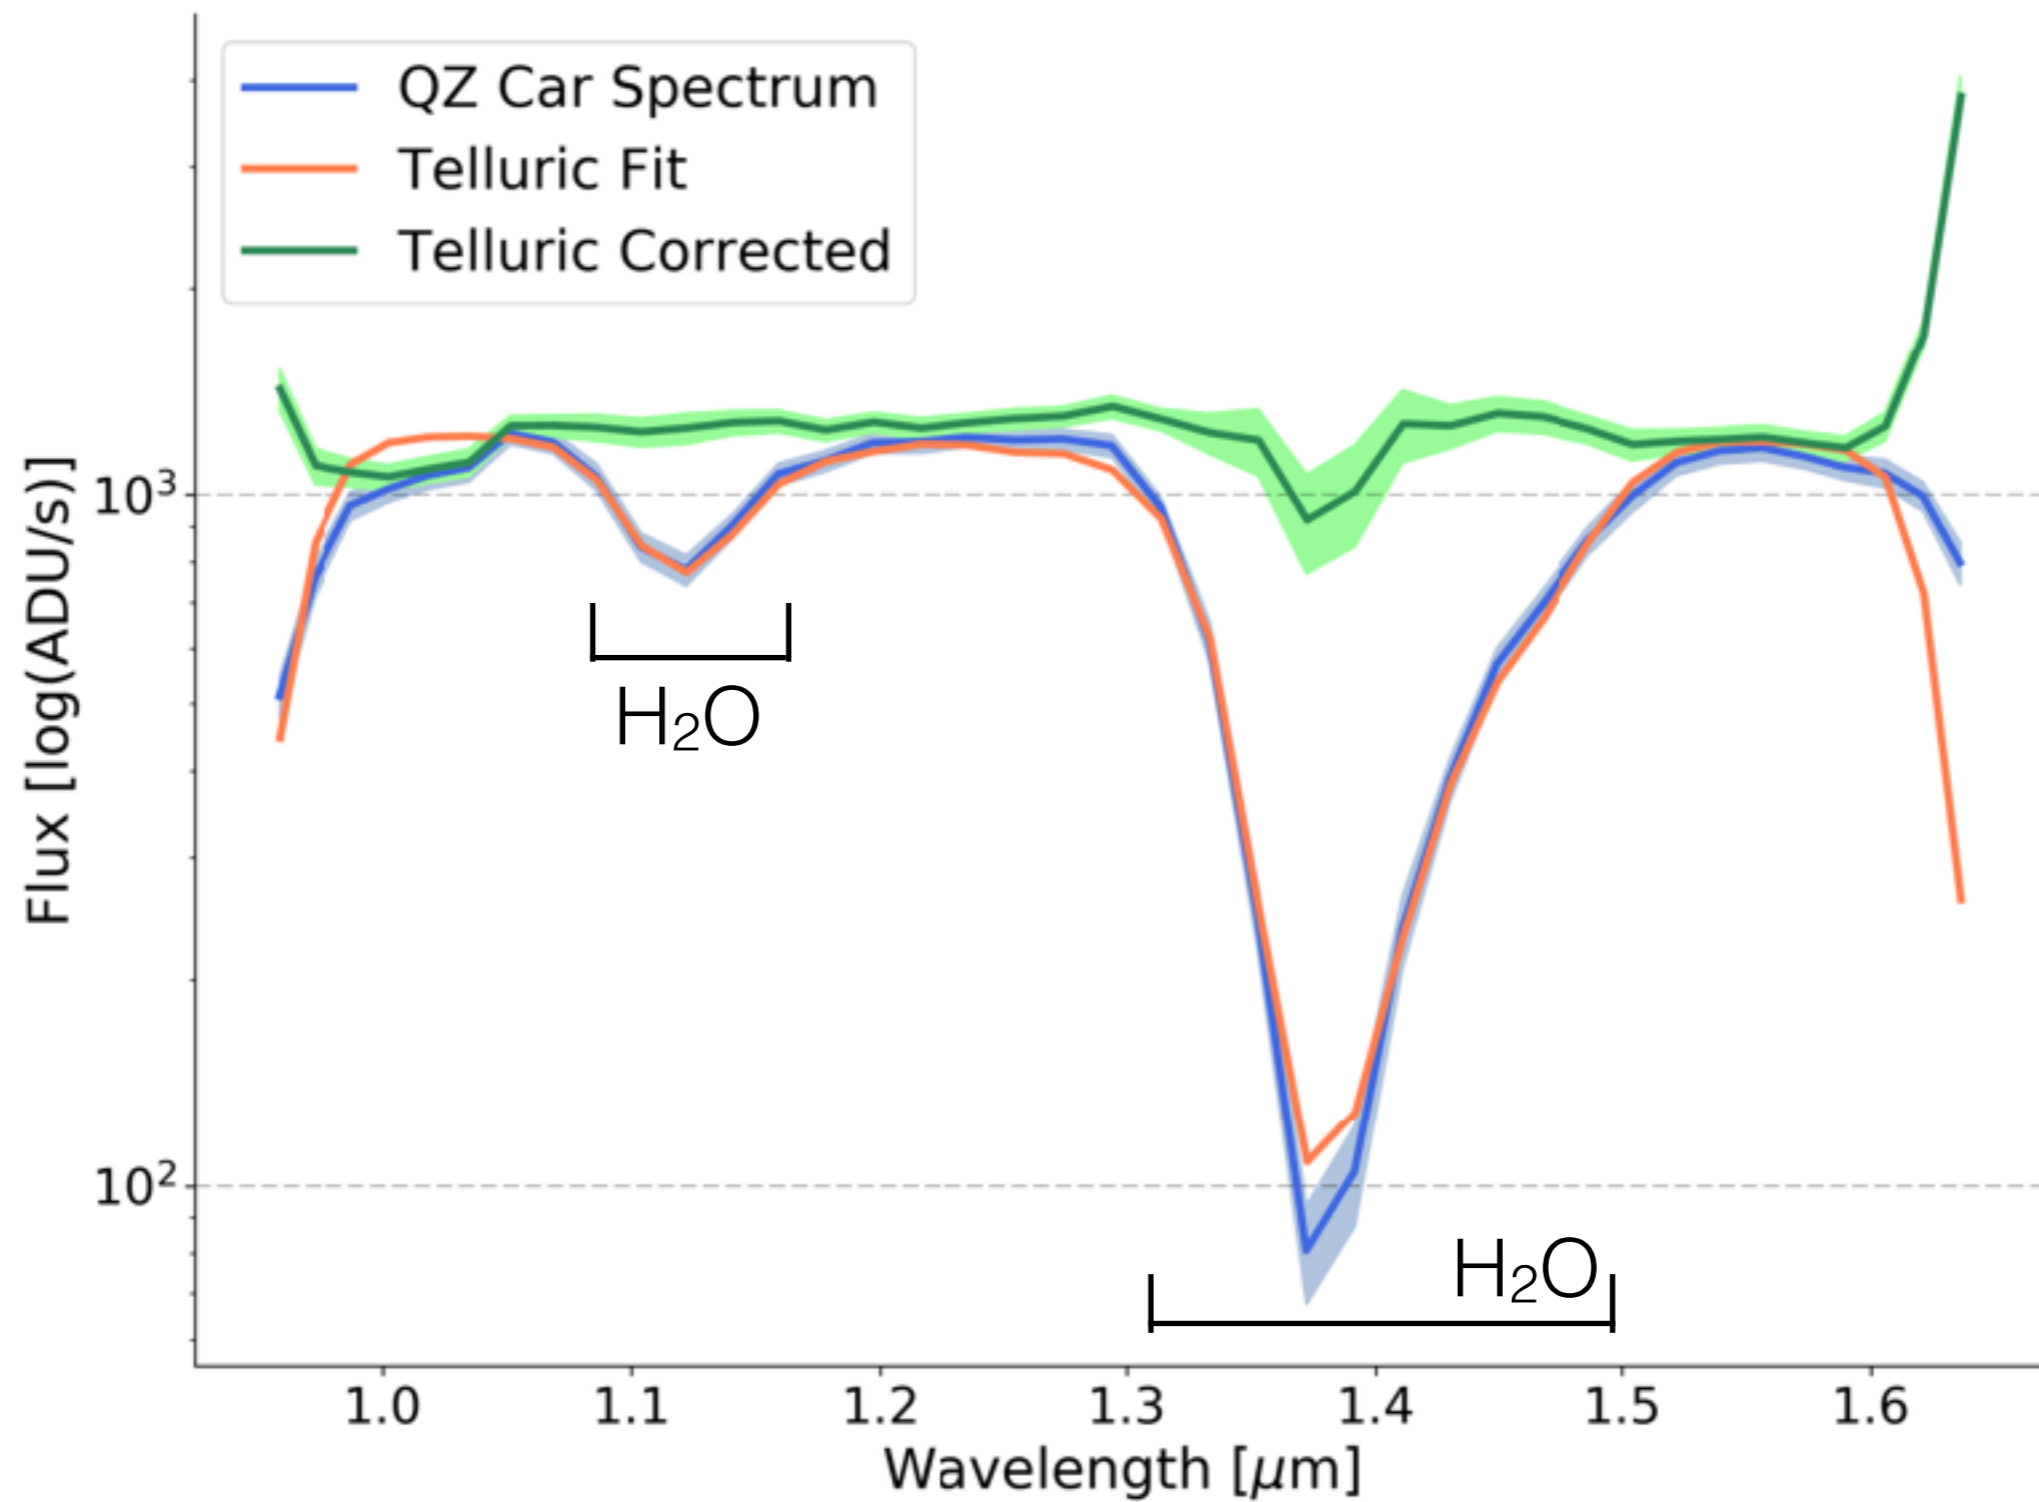

Collapsed image

NEGFC technique applied

PSF Fitting

Multiplicity Results - IFS

Images	Visible companions (SNR > 5 σ)	Candidates (5 σ > SNR > 3 σ)
28	6	12

- ▶ Detection ratio ≈ 0.42 companions/star
- ▶ Expected ≈ 35 companions / 84 images

Further Work

- ▶ Use FASTWIND to **model** QZ Car - the central 4-star system
- ▶ **Characterise** companion properties
- ▶ Apply techniques to **full** dataset
- ▶ Obtain remaining **56 stars** with SPHERE
- ➔ Use database to look for **multiplicity** properties

Analysis Techniques
